

Shut down iphone x manually

Continue

If an app won't respond or seems frozen, you can close it, then open it again. You should close an app only if it's unresponsive. The way you close an app depends on the type of device that you have. Find your iPhone or iPod touch model below, then follow the steps. Or learn how to close an app on your iPad. From the Home Screen, swipe up from the bottom of the screen and pause in the middle of the screen. Swipe right or left to find the app that you want to close. Swipe up on the app's preview to close the app. Double-click the Home button to show your most recently used apps. Swipe right or left to find the app that you want to close. Swipe up on the app's preview to close the app. Sony does a good job of pushing regular updates to the PlayStation 4 family, most of which install without a hitch. If you're having issues getting an update to download or install, however, it's time to do it manually. Why You Might Need to Manually Install an Update The majority of the time, you can count on your PlayStation to download any system updates automatically, which is nice. But if an update ever fails—and it does happen—then you'll need to grab the download and flash it yourself. You might also find yourself in a situation where your PS4 doesn't have access to Wi-Fi—maybe you've carried it with you on vacation. Again, this is a time when you'll want to manually install an update. The good news is that manual installation is a breeze. There are a two ways of doing it: through the system menu and in safe mode. You'll want to start with the system menu, and if that doesn't work, move on to Safe Mode. Naturally, we're going to cover both here. Before you start, you'll need a couple of things: Access to an internet connection on some other device—phone, computer, etc. A USB flash drive with enough space to download the update (8 GB should be more than enough). The latest update file. A micro-USB cable (only if you need to install the update in Safe Mode) Note: If you'll be downloading the update file with your phone, you'll need a flash drive that's compatible with your handset. We have guides on how to use a flash drive with both iPhone and Android. If you have everything you need, let's get started. How to Install an Update from the System Menu First things first—grab the latest download from the Playstation website. Sony does an excellent job of providing manual downloads for users who may be experiencing issues. Next, you need to move the update to your flash drive. You can't just copy it straight over, though—it has to fall into a certain file structure. So, you'll need to create a couple of folders on your flash drive before you copy the file over. First, create a folder named PS4, then create another folder inside your new PS4 folder named UPDATE. Use all caps for the names of both folders. Finally, copy the update file you downloaded into the UPDATE folder. When you have the update in the right folder structure, plug the flash drive into one of the PS4's USB ports, and then open the Settings menu. Scroll down a bit, and select the "System Software Update" entry. When you do this, your PS4 should automatically find the update file on your flash drive and install it. If all goes well, you're done. The PS4 will handle this update just like it would if it had been automatically downloaded. If installing the update through the system menu still doesn't work, you'll need to try installing it from Safe Mode. How to Install an Update using Safe Mode If updating automatically and manually through the system menu have both failed, updating through Safe Mode should essentially "force" the installation. You'll need to set up your flash drive the same way we described in the previous section. Download the update file, create the PS4/UPDATE folder structure on your flash drive, and then move the update file into the UPDATE folder. Next, you'll need to unmount any external storage you have attached to your PS4. If you have more than one drive attached, the PS4 will get confused and won't know where to check for the update. Just make sure you unmount external storage using the System > Storage menu—don't just unplug it. Once the update is finished, you can remount the drive. With all other external drives unmounted, go ahead and completely shut down your PS4. When the power light is off (indicating the system is totally shut down), insert your flash drive, and then press the PS4 power button and hold it down. The unit will beep once when the system turns on, but continue holding the button until it beeps again—it takes about seven seconds. This second beep means the system is entering Safe Mode. When the system turns on, connect a DualShock controller over USB, and then press the PS button. When the Safe Mode menu loads, select "Update System Software" to launch the update menu. On the next screen, choose the "Update from USB Storage Device" option. If you haven't already connected your flash drive, you'll have a chance to do so now. Just select "OK" to continue when your drive is connected. Your PS4 will take a few minutes to search for the update file, and then it should tell you there's a system update available. Click "Next" to install the update. The PS4 will take a few seconds to copy the update file from the flash drive. When that's done, click the "Update" button to restart the system and install the update. After the PS4 restarts, it begins the update. Just let it do its thing while you chill out. When it's finished, the PS4 will restart again, and you should be running the newest version. Done and done. Select version: iOS 15 iOS 14 iOS 13 iOS 12 Modifying this control will update this page automatically Welcome What's new in iOS 15 Calculator See the world clock Set an alarm Use the timer or stopwatch Compass Get music, movies, and TV shows Get ringtones Manage purchases and settings Magnify nearby objects Change settings Detect people around you Measure View and save measurements Measure a person's height Use the level Shortcuts Stocks Tips Check the weather View the weather icons Use iPhone with iPad, iPod touch, Mac, and PC Restart, update, reset, and restore Safety, handling, and support Copyright Use the side button or Sleep/Wake button (depending on your model) to turn on iPhone. You can use the top button (along with either volume button on some models) or Settings to turn off iPhone.If your iPhone isn't working as expected, you can try restarting it by turning it off, then turning it back on. If turning it off and on doesn't fix the issue, try forcing it to restart.Press and hold the side button or Sleep/Wake button (depending on your model) until the Apple logo appears.iPhone with Face ID: Simultaneously press and hold the side button and either volume button until the sliders appear, then drag the Power Off slider.iPhone with the Home button: Press and hold the side button or Sleep/Wake button (depending on your model), then drag the slider.All models: Go to Settings > General > Shut Down, then drag the slider. Helpful? Thanks for your feedback. In this day and age, there's no reason to shut down your computer, then sit through the boot-up process when you want to use it. Save yourself time by putting your computer to sleep or hibernating it instead. Modern computers—whether they're laptops, desktops, or tablets—are designed to be used in this way. This applies to Windows PCs, Macs, Linux systems, Chromebooks, and everything else. Why Sleep and Hibernate Are Awesome If you regularly use a computer, shutting down is extremely inconvenient. Before you shut down, you need to save your work. The next time you go to boot your computer, you'll have to sit through the boot-up process, manually relaunch all the programs you were using, and reopen all the documents you were editing. Sleep and hibernate, on the other hand, preserve your session. When you're done using your computer, you can just close your laptop's lid (or, on a desktop, choose the Sleep or Hibernate option). You don't have to worry about closing your programs and saving your documents. When you come back and press the power button, everything will be exactly as you left it. It'll start back up within a second or two if you put it to sleep, or a bit longer than that if you hibernated it. All your open programs and documents will be in the same place, and you can immediately start doing whatever you need without sitting through a boot-up process, launching your programs, and opening your documents. How Sleep and Hibernate Work Sleep puts your computer into a very low-power mode, and saves its current state in its RAM. Your computer continues drawing a small amount of power to keep that RAM powered on. When you turn on your computer, it can immediately resume from where it left off in just a second or two. Hibernate, on the other hand, saves your computer's state to the hard drive, and shuts down completely. Your computer won't draw any additional power, like it does with sleep. When you turn your computer back on, it will load the data from the disk into RAM and resume from where it left off. You'll go right back to where you were with all your programs and documents open. It'll take a bit longer to resume, but it won't take as long as booting up if you had shut down your computer. How long it takes depends on the speed of your hard drive—if you have a speedy solid-state drive, it should be pretty quick. In other words, Hibernate is literally the same as shutting down your computer—only with all your work saved exactly as you left it. How to Sleep or Hibernate Your Computer RELATED: How to Re-Enable Hibernation in Windows 8 and 10 New Windows computers are set to automatically sleep after a period of time, and then automatically hibernate after that. Laptops of all types are usually configured to sleep when you close the lid and wake up when you open it. You can customize how long your computer waits before sleeping, however. Head to Control Panel > Hardware and Sound > Power Options > Change When the Computer Sleeps to change this setting. The power button can put your computer to sleep when you press it, if you like. Head to Control Panel > Hardware and Sound > Power Options > Choose What the Power Button Does to choose what happens when you press your computer's power button. You can also select Sleep or Hibernate from the Power menu. However, you must re-enable the Hibernate option on Windows 10 before it will appear there. Don't Worry About the Power Usage The only real downside to using sleep is increased power usage. On a desktop, this is extremely low and will only add a few cents to your monthly electric bill, on average. On a laptop, sleep will continue draining the battery bit by bit. But laptops are generally configured to automatically hibernate after a few hours, so they won't just sit losing battery power forever. Sleep mode means you can pick up your laptop and use it much more quickly, which could actually save you battery power over sitting through a long boot process several times a day. Either way, if you're concerned about electricity usage, you can just hibernate your computer instead. Hibernation will use no more electricity than simply shutting it off. Bugs Shouldn't Be a Problem, Either Some people might think Windows needs a daily reboot to function properly, but it shouldn't. Sure, you might occasionally want to reboot Windows to solve problems—you'll have to reboot after updating Windows and installing many hardware drivers anyway. But you don't need to reflexively reboot every day. If your Windows PC needs a daily reboot, it has deeper problems you need to fix. Older computers might have had trouble with sleep or hibernate in the past due to hardware driver issues. Modern computers shouldn't have those issues. In fact, most are configured to automatically sleep and hibernate out of the box. Don't worry about it unless you're using a much older computer that you know has problems with sleep and hibernate. Unfortunately for Linux users, Linux may have problems hibernating or even sleeping on some PCs, which is why hibernate is disabled by default on Ubuntu. But, assuming your hardware manufacturer supports the operating system you're using on your computer, it should work fine. Shutting down, for the most part, is a relic of the past. With sleep and hibernate, you get much more convenience, with little to no downside.
